

twinlab.list_emulators

`twinlab.list_emulators(verbose=False)`

List trained emulators that exist in the user's twinLab cloud account.

These trained emulators can be used for a variety of inference operations (see methods of the Emulator class). Setting `verbose=True` will also show the state of currently training emulators, as well as those that have failed to train. Information about start time and current/final run time will also be shown if `verbose=True`.

Parameters:

verbose ([bool](#), *optional*) – Display information about the emulators while running.

Returns:

Currently trained emulators.

Return type:

[list](#)

Example

```
emulators = tl.list_emulators()
print(emulators)
```

```
['biscuits', 'gardening', 'new-emulator', 'my-emulator']
```
